

Expected result: two text files with scripts implementing the following tasks.

1. Document-oriented database:

Write a script to create a document-oriented database that will store the information about room booking in hotels.

The database usually receives two main types of queries:

- Display information about rooms in a hotel.
- Display all the information about room reservation (dates, list of guests, room size and facilities in the room).

Add all the data from the relational database to the created database, the script for the relational database can be found in the Booking.sql file.

After setting up the database and incorporating all the information from the relational database, implement the following commands:

1. Retrieve information on reservations made by Lucas.
2. Enrika cancelled her reservation, this data needs to be removed from the database.
3. Add a note to the reservation made by Lucas that he will arrive at the hotel after 10 pm.
4. In the 'Redisson' hotel, all rooms have had their 'TVs' replaced with 'Flat-screen TVs'. Update the information in the database accordingly.
5. Calculate how many bookings were made in each hotel.

2. Graph database:

Write a script to create a graph database for storing information about users and the photos they've posted.

The database should contain all data from the relational database, the script of which can be found in PhotoNet.sql file.

After creating the database and adding all the information from the relational database to it, write the following commands:

1. Write a command which changes the text of the comment from Holly under the photo named 'file_name3' to 'Very Good'.
2. Write a command that will do John has unfollowed all the users he used to follow.
3. Write a command that will display all photos of the users whom Mary follows to.
4. Write a command that returns the count of likes placed on Claire's photos.
5. If Claire follows John and Adrian, and Holly also follows Adrian, we can assume that Holly might be interested in following John. Write a command that will return the users we could recommend Holly to follow.
